

How-To: DEALING WITH DEER

Deer can be more than a nuisance in the garden – they can totally destroy it! Here are some tips and techniques for protecting your garden plants from the devastating munching of deer.

DEER FOOTPRINT

ARE DEER THE CULPRIT?

Most often, you'll know if you've got deer frequenting the garden. If you haven't seen them, you've probably seen their hoof prints, droppings, and browsing damage on plants. If you aren't sure whether deer are the culprit, keep an eye out for the signs listed above, and quietly observe the garden in the evening, when deer are most active. Damage on plants is usually significant. Groundhog and rabbit damage can look similar, but deer can reach higher on plants and remove more plant material in one feeding.

RESISTANT PLANTS

Deer eat most plants in the vegetable garden, with the exception of crops in the onion family, including garlic, leeks, scallions, chives, along with onions. They also usually avoid hot peppers. Deer eat a large variety of ornamental plants, flowers, and bushes – sometimes even those considered to be deer-resistant. Check online lists for deer-resistant plants but also ask other gardeners in the neighborhood what crops have worked for them.

BARRIERS AND REPELLENTS

The best way to protect a garden from deer is to place it in an area that is inaccessible to the deer. This can be easier said than done! To keep deer out, fencing must be at least 8' tall. Alternatively, two strands of electric fence, both 3' high and 3' apart, can be used with some success, as deer are wary of jumping across a double fence. Electric fence can be powered by a solar charger, if there is no electricity at the garden site. If deer fencing is not an option in an area with significant deer population, reconsidering the location of the garden may be the best plan. Could the garden be grown in large containers on a deck? Alternatively, if you're growing short crops, covering them with fabric row cover as a barrier can be effective.

If deer fencing is not an option and deer pressure is light to moderate, repellents can be a viable option. Repellents made of various substances like mint, garlic and hot pepper, putrefied egg, and blood meal are commercially available. Some gardeners make their own repellents from similar substances or from human hair, urine, or soap. These types of repellents can be effective, especially if they are applied around the perimeter of the garden, like a fence. They need to be reapplied after each rain, so they can be labor intensive.

Another option is to scare away deer with active repellents. For instance, a dog allowed to roam at will in a yard can be an effective tool against deer. A commercially available tool called the Scarecrow can be attached to a hose and emits a rapid burst of water when it senses movement. Ultrasonic devices are also

available, but don't seem to work consistently. Also, sometimes their emitted sound can be heard by human ears, which can be annoying to residents and neighbors.

RECAP: DEER CONTROL OPTIONS

- PLANT RESISTANT CROPS
- 8' OR TALLER FENCE
- DOUBLE ELECTRIC FENCE, 3' TALL, 3' BETWEEN FENCING
- RECONSIDER GARDEN LOCATION – COULD IT BE WORTH MOVING TO A LESS DEER-HEAVY AREA OR PLANTING A CONTAINER GARDEN?
- FABRIC ROW COVER
- COMMERCIALLY-MADE REPELLENTS
- HOMEMADE REPELLENTS
- DOG WITH CONSTANT ACCESS TO GARDEN AREA
- THE “SCARECROW” – A WATER EMITTING DEVICE
- ULTRASONIC DEVICES
